

Summary of Data Flow in Pipeline

1. Initial extraction of data from external data sources
2. Initial Transformation of data
3. Acts as an in house staging area to model new bases, datasets, or reporting methods with more flexible and/or convenient software tools
4. Loading the cleaned data onto the data warehouse
5. Creating departmental subsets of data or aggregated views
6. Loading the data from the datamarts into in-house Power BI data files
7. Bringing in operational or non-operational data from health records to in-house operational Excel files
8. Loading internal, operational data into the database models in Power BI
9. Creating the reports, analysts, and dashboards
